Question 1: Write your name and student number.

Solution: Erling Haaland, 9

Question 2: Consider the context-free grammar $G = (V, \Sigma, R, S)$, where the set of variables is $V = \{S, A, B\}$, the set of terminals is $\Sigma = \{a, b\}$, the start variable is $S$, and the rules are as follows:

\[
\begin{align*}
S & \rightarrow abB \\
A & \rightarrow \varepsilon \mid aabB \\
B & \rightarrow bbAa
\end{align*}
\]

Prove that the language $L(G)$ that is generated by $G$ is equal to

\[L(G) = \{ab(baa)^n bba(ba)^n : n \geq 0\}.
\]

(Remember: To prove that two sets $X$ and $Y$ are equal, you have to prove that $X \subseteq Y$ and $Y \subseteq X$.)

Solution: We write

\[L = \{ab(baa)^n bba(ba)^n : n \geq 0\},
\]

so that we have to prove that $L = L(G)$.

First we prove that $L \subseteq L(G)$. If we start with the variable $B$ and apply the rule $B \rightarrow bbAa$ followed by the rule $A \rightarrow aabB$, then we see that

\[B \Rightarrow bbAa \Rightarrow (baa)B(ba).
\]

If we repeat this $n$ times, then we see that

\[B \Rightarrow (bbaa)^n B(ba)^n.
\]

It follows that, for each integer $n \geq 0$,

\[
\begin{align*}
S & \Rightarrow abB \\
& \Rightarrow ab(baa)^n B(ba)^n \\
& \Rightarrow ab(baa)^n bbAa(ba)^n \\
& \Rightarrow ab(baa)^n bb\varepsilon a(ba)^n = ab(baa)^n bba(ba)^n.
\end{align*}
\]

This proves that each string in $L$ can be derived from the start variable $S$. In other words, this proves that $L \subseteq L(G)$.

It remains to show that $L(G) \subseteq L$, i.e., no other strings can be derived from the start variable $S$.

To derive a string in $L(G)$, we must start with the start variable $S$. At the start, the only rule that can be applied is $S \rightarrow abB$, after which the only rule that can be applied is

1
At this moment, we apply either the rule $A \rightarrow \varepsilon$ or the rule $A \rightarrow aaBb$. In the first case, we are done. In the second case, we can only apply the rule $B \rightarrow bbAA$, after which we either apply $A \rightarrow \varepsilon$ or $A \rightarrow aaBb$. From this, it follows that the only derivations in the grammar $G$ are the ones given in the proof of the fact that $L \subseteq L(G)$.

**Question 3:** Give context-free grammars that generate the following languages. For each case, justify your answer.

(3.1) $\{a^{n+3}b^n : n \geq 0\}$. The set of terminals is equal to $\{a, b\}$.

(3.2) $\{a^n b^m : n \geq 0, m \geq 0, 2n \leq m \leq 3n\}$. The set of terminals is equal to $\{a, b\}$.

(3.3) $\{a^n b^n c^n : m \geq 0, n \geq 0\}$. The set of terminals is equal to $\{a, b, c\}$.

**Solution:**

We start with

$L_1 = \{a^{n+3}b^n : n \geq 0\}$.

We can write $L_1$ as

$L_1 = aaaaL'_{1}$,

where any string in $L'_{1}$ is either

- empty or
- starts with $a$, followed by a string in $L'_{1}$, and ends with $b$.

This leads to the context-free grammar $G = (V, \Sigma, R, S)$, where $V = \{S, A\}$, $\Sigma = \{a, b\}$, and $R$ consists of the rules

$S \rightarrow aaaaA$

$A \rightarrow \varepsilon \mid aAb$

Observe that from $A$, we can derive all strings of the form $a^n b^n$ for some $n \geq 0$. From $S$, we can derive all strings that start with $aaaa$ and are followed by any string that can be derived from the variable $A$. Therefore, from $S$, we can derive all strings in $L_1$ (and nothing else).

Next we do

$L_2 = \{a^n b^m : n \geq 0, m \geq 0, 2n \leq m \leq 3n\}$.

Any string in $L_2$ is either

- empty or
- is a non-empty string in which all the $a$’s are to the left of all the $b$’s, and for each $a$, there are two or three $b$’s.

This leads to the context-free grammar $G = (V, \Sigma, R, S)$, where $V = \{S\}$, $\Sigma = \{a, b\}$, and $R$ consists of the rules

$S \rightarrow \varepsilon \mid aSbb \mid aSbbb$

It is clear that for each string in $L(G)$, all $a$’s are to the left of all $b$’s, and the number of $b$’s is at least twice and at most three times the number of $a$’s.
It remains to argue that every string in $L_2$ is in $L(G)$. Let $u = a^n b^m$ be an arbitrary string in $L_2$, where $n \geq 0$, $m \geq 0$, and $2n \leq m \leq 3n$. The string $u$ is derived from the start variable $S$ in the following way:

- Start with $S$, and apply the rule $S \rightarrow aSbbbb$ exactly $m-2n$ times (note that $m-2n \geq 0$). This gives
  $$S \Rightarrow a^{m-2n}Sb^{3(m-2n)}.$$  

- Now apply the rule $S \rightarrow aSbb$ exactly $3n-m$ times (note that $3n-m \geq 0$). This gives
  $$S \Rightarrow a^{m-2n}(a^{3n-m}b^{2(3n-m)})b^{3(m-2n)}.$$  

- Finally, apply the rule $S \rightarrow \varepsilon$. This gives
  $$S \Rightarrow a^{m-2n}(a^{3n-m}\varepsilon b^{2(3n-m)})b^{3(m-2n)} = a^n b^m = u.$$  

Finally, we do

$$L_3 = \{a^n b^n c^n : m \geq 0, n \geq 0\}.$$  

Any string in $L_3$

- starts with zero or more $a$’s, followed by a string of the form $b^n c^n$, for some $n \geq 0$.

This leads to the context-free grammar $G = (V, \Sigma, R, S)$, where $V = \{S, X\}$, $\Sigma = \{a, b, c\}$, and $R$ consists of the rules

$$
S \rightarrow AX \\
A \rightarrow \varepsilon \mid aA \\
X \rightarrow \varepsilon \mid bXc
$$

Observe that from $A$, we can derive all strings of the form $a^m$ for some $m \geq 0$. From $X$, we can derive all strings of the form $b^n c^n$, for some $n \geq 0$. Therefore, from $S$, we can derive all strings in $L_3$ (and nothing else).

**Question 4:** Give (deterministic or nondeterministic) pushdown automata that accept the following languages. For each pushdown automaton, start by explaining the algorithm in plain English, then mention the states that you are going to use, then explain the meaning of these states, and finally give the list of instructions.

**(4.1)** $\{a^{2n}b^n : n \geq 0\}$.

**(4.2)** $\{ww^R : w \in \{a, b\}^*\}$.

(If $w = w_1 \ldots w_n$, then $w^R = w_n \ldots w_1$. Note that $\varepsilon^R = \varepsilon$.)

**Solution:** For the language

$$\{a^{2n}b^n : n \geq 0\}$$

we can use a deterministic pushdown automaton. The approach is as follows:
• Walk along the input string from left to right.

• While reading a’s: For each a, push a symbol S onto the stack.

• While reading b’s: For each b, pop the top two symbols from the stack. Popping two symbols is done in two steps: Pop the top symbol and do not move on the input tape; then again pop the (new) top symbol and make one step to the right on the input tape.

• Tape alphabet \( \Sigma = \{a, b\} \).

• Stack alphabet \( \Gamma = \{\$, S\} \).

We use three states:

• \( q_a \): This is the start state. If we are in this state, then we are reading the block of a’s. The stack contains $ at the bottom; the number of S-symbols on the stack is equal to the number of a’s read so far.

• \( q_b \): We have already seen a b. If the current symbol on the input tape is b, then we are going to do the first pop.

• \( q_b^\prime \): The current symbol on the input tape is b; we are going to do the second pop.

The instructions are as follows.

• \( q_a \) a$ \rightarrow q_a R$S (push S onto the stack)

• \( q_a \) aS \rightarrow q_a RSS (push S onto the stack)

• \( q_a \) b$ \rightarrow q_a N$
  – Explanation: The input string starts with 1; loop forever and, thus, do not accept.

• \( q_a \) bS \rightarrow q_b NS
  – Explanation: We have reached the first b. We switch to state \( q_b \), do not move on the input tape, and do not modify the stack.

• \( q_a \) □$ \rightarrow q_a N\varepsilon
  – Explanation: The input string is empty. We make the stack empty and, thus terminate and accept.

• \( q_a \) □S \rightarrow q_a NS
  – Explanation: The input string is non-empty and only contains a’s; loop forever and, thus, do not accept.

• \( q_b \) a$ \rightarrow q_b N$

4
- Explanation: There is \( a \) to the right of \( b \); loop forever and, thus, do not accept.
  \( q_b a S \rightarrow q_b N S \)
  - Explanation: There is \( a \) to the right of \( b \); loop forever and, thus, do not accept.
  \( q_b b S \rightarrow q'_b N \varepsilon \)
  - Explanation: The first pop for the current \( b \).
  \( q_b \square S \rightarrow q_b N S \)
  - Explanation: Too many \( a \)'s; loop forever and, thus, do not accept.
  \( q_b b S \rightarrow q'_b N \varepsilon \)
  - Explanation: Too many \( b \)'s; loop forever and, thus, do not accept.
  \( q_b \square S \rightarrow q_b N S \)
  - Explanation: Too many \( a \)'s; loop forever and, thus, do not accept.
  \( q_b b S \rightarrow q'_b N \varepsilon \)
  - Explanation: Too many \( b \)'s; loop forever and, thus, do not accept.
  \( q_b \square S \rightarrow q_b N S \)
  - Explanation: Too many \( a \)'s; loop forever and, thus, do not accept.
  \( q_b b S \rightarrow q'_b N \varepsilon \)
  - Explanation: The second pop for the current \( b \).
  \( q_b \square S \rightarrow q_b N S \)
  - Explanation: Cannot happen.
  \( q'_b b S \rightarrow q_b R \varepsilon \)
  - Explanation: The second pop for the current \( b \).
  \( q_b \square S \rightarrow q_b N S \)
  - Explanation: Cannot happen.
  \( q'_b b S \rightarrow q_b R \varepsilon \)
  - Explanation: Cannot happen.

For the language
\[
\{ww^R : w \in \{a, b\}^*\}
\]
we use a nondeterministic pushdown automaton. The approach is as follows:
- Walk along the input string from left to right.
- Guess when we enter the second half of the input string.
- All symbols in the first half of the input string are pushed onto the stack.
- After we have entered the second half, we check if the contents of the stack (from top to bottom) is the same as the remaining part of the input string.
• Tape alphabet $\Sigma = \{a, b\}$.

• Stack alphabet $\Gamma = \{\$, a, b\}$.

We will use two states:

• $q$: This is the start state. If we are in this state, then we have not guessed yet that we have entered the second half of the input string.

• $q'$: We have guessed already that we have entered the second half of the input string.

The instructions are as follows.

• $qa\$ \rightarrow qR\$a$ (push; stay in start state)

• $qa\$ \rightarrow q'R\$a$ (push, switch to $q'$)

• $qb\$ \rightarrow qR\$b$ (push; stay in start state)

• $qb\$ \rightarrow q'R\$b$ (push, switch to $q'$)

• $q\Box\$ \rightarrow q\N\varepsilon$ (input empty; accept)

• $qaa \rightarrow qRaa$ (push; stay in start state)

• $qaa \rightarrow q'Raa$ (push, switch to $q'$)

• $qba \rightarrow qRab$ (push; stay in start state)

• $qba \rightarrow q'Rab$ (push, switch to $q'$)

• $q\Box a \rightarrow q\N a$ (loop forever)

• $qab \rightarrow qRba$ (push; stay in start state)

• $qab \rightarrow q'Rba$ (push, switch to $q'$)

• $qbb \rightarrow qRbb$ (push; stay in start state)

• $qbb \rightarrow q'Rbb$ (push, switch to $q'$)

• $q\Box b \rightarrow q\N b$ (loop forever)

• $q'a\$ \rightarrow q'\N\$ (loop forever)

• $q'b\$ \rightarrow q'\N\$ (loop forever)

• $q'\Box\$ \rightarrow q'\N\varepsilon$ (accept)

• $q'aa \rightarrow q'R\varepsilon$ (pop)
- $q'ba \rightarrow q'Na$ (loop forever)
- $q'\Box a \rightarrow q'Na$ (loop forever)
- $q'ab \rightarrow q'Nb$ (loop forever)
- $q'bb \rightarrow q'R\varepsilon$ (pop)
- $q'\Box b \rightarrow q'Nb$ (loop forever)

**Question 5:** Prove that the following languages are not context-free:

(5.1) $\{a^n : n \geq 0\}$
(5.2) $\{a^{n^2}b^n : n \geq 0\}$

**Solution:** First, we prove that the language

$$A = \{a^n : n \geq 0\}$$

is not context-free.

Assume that $A$ is context-free. By the Pumping Lemma, there is an integer $p \geq 1$, such that for all strings $s \in A$ with $|s| \geq p$, the following holds: We can write $s = uvxyz$, where

1. $vy$ is non-empty,
2. $vxy$ has length at most $p$,
3. the string $uv^i xy^i z$ is in $A$, for all $i \geq 0$.

**Note:** We may assume that $p \geq 2$: If, for this particular language, the pumping length is equal to one, then the statement of the Pumping Lemma is also true if we take $p = 2$.

Consider the pumping length $p$. We choose $s = a^p$. Then $s$ is a string in $A$, and the length of $s$ is $p!$, which is at least $p$ (because $p \geq 1$). Thus, we can write $s = uvxyz$ such that 1., 2., and 3. above hold.

Let $k$ be the length of the string $vy$. It follows from 1. that $k \geq 1$. It follows from 2. that $k = |vy| \leq |vxy| \leq p$.

Consider the string $uvxyyz$. This string is equal to $a^{p^2+k}$. We have (using the fact that $p \geq 2$)

$$p! < p! + k \leq p! + p < p \cdot p! + p! = (p + 1)!.$$ 

Thus, the length of $uvxyyz$ is strictly between two consecutive factorials. Therefore, this string is no in the language $A$. This is a contradiction, because by the Pumping Lemma, this string does belong to $A$. We conclude that $A$ is not a context-free language.

Next we prove that the language

$$B = \{a^{n^2}b^n : n \geq 0\}$$
is not context-free.

Assume that $B$ is context-free. By the Pumping Lemma, there is an integer $p \geq 1$, such that for all strings $s \in B$ with $|s| \geq p$, the following holds: We can write $s = uvxyz$, where

1. $vy$ is non-empty,
2. $vxy$ has length at most $p$,
3. the string $uv^i xy^i z$ is in $B$, for all $i \geq 0$.

Consider the pumping length $p$. We choose $s = a^{p^2}b^p$. Then $s$ is a string in $B$, and the length of $s$ is $p^2 + p$, which is at least $p$. Thus, we can write $s = uvxyz$ such that 1., 2., and 3. above hold.

**Case 1:** Both $v$ and $y$ are in the block of $a$’s.

Then the string $s' = uvvxyyz$ contains at least $p^2 + 1$ many $a$’s and exactly $p$ many $b$’s. Therefore, this string is not in $B$. But, by the Pumping Lemma, $s'$ is contained in $B$. This is a contradiction.

**Case 2:** Both $v$ and $y$ are in the block of $b$’s.

Then the string $s' = uvvxyyz$ contains exactly $p^2$ many $a$’s and at least $p + 1$ many $b$’s. Therefore, this string is not in $B$. But, by the Pumping Lemma, $s'$ is contained in $B$. This is a contradiction.

**Case 3:** The string $vy$ contains at least one $a$ and at least one $b$.

Let $k$ and $\ell$ be such that $vy = a^k b^\ell$. Then $k \geq 1$, $\ell \geq 1$, and $k + \ell \leq p$.

The string $s' = uvvxyyz$ is equal to

$$s' = a^{p^2 + k} b^{p + \ell}.$$

By the Pumping Lemma, $s'$ is in $B$, implying that

$$(p + \ell)^2 = p^2 + k,$$

i.e.,

$$k = 2p\ell + \ell^2.$$

However,

$$2p\ell + \ell^2 \geq 2p + 1 > p \geq k + \ell > k.$$

This is a contradiction.

**Question 6:** We have seen that the regular languages are closed under the union, intersection, complement, concatenation, and star operations. In this question, we consider these operations for context-free languages.

(6.1) Let $L$ and $L'$ be context-free languages over the same alphabet $\Sigma$. Prove that the union $L \cup L'$ is also context-free.

(6.2) Let $L$ and $L'$ be context-free languages over the same alphabet $\Sigma$. Prove that the concatenation $LL'$ is also context-free.
Let $L$ be a context-free language over the alphabet $\Sigma$. Prove that the star $L^*$ of $L$ is also context-free.

In Question 3, you have shown that $L = \{a^mb^n c^n : m \geq 0, n \geq 0\}$ is a context-free language. By a symmetric argument, the language $L' = \{a^m b^m c^n : m \geq 0, n \geq 0\}$ is context-free.

Prove that the intersection of two context-free languages is not necessarily context-free.

(You may use any result that was proven in class.)

Prove that the complement of a context-free language is not necessarily context-free.

Solution: For the first three parts, since $L$ is context-free, there is a context-free grammar $G_1 = (V_1, \Sigma, R_1, S_1)$ that generates $L$. Similarly, since $L'$ is context-free, there is a context-free grammar $G_2 = (V_2, \Sigma, R_2, S_2)$ that generates $L'$. We assume that $V_1 \cap V_2 = \emptyset$. (If this is not the case, then we rename the variables of $G_2$.)

First, we show that $L \cup L'$ is context-free. Let $G = (V, \Sigma, R, S)$ be the context-free grammar, where

- $V = V_1 \cup V_2 \cup \{S\}$, where $S$ is a new variable, which is the start variable of $G$,
- $R = R_1 \cup R_2 \cup \{S \rightarrow S_1 | S_2\}$.

From the start variable $S$, we can derive the strings $S_1$ and $S_2$. From $S_1$, we can derive all strings of $L$, whereas from $S_2$, we can derive all strings of $L'$. Hence, from $S$, we can derive all strings of $L \cup L'$. In other words, the grammar $G$ generates the union of $L$ and $L'$. Therefore, this union is context-free.

Next, we show that $LL'$ is context-free. Let $G = (V, \Sigma, R, S)$ be the context-free grammar, where

- $V = V_1 \cup V_2 \cup \{S\}$, where $S$ is a new variable, which is the start variable of $G$,
- $R = R_1 \cup R_2 \cup \{S \rightarrow S_1 S_2\}$.

From the start variable $S$, we can derive the string $S_1 S_2$. From $S_1$, we can derive all strings of $L$, whereas from $S_2$, we can derive all strings of $L'$. Hence, from $S$, we can derive all strings of the form $uv$, where $u \in L$ and $v \in L'$. In other words, the grammar $G$ generates the concatenation of $L$ and $L'$. Therefore, this concatenation is context-free.

Next, we show that $L^*$ is context-free. Any string in $L^*$ is either

- empty or
• a string in $L$, followed by a string in $L^*$.

Let $G = (V, \Sigma, R, S)$ be the context-free grammar, where

- $V = V_1 \cup \{S\}$, where $S$ is a new variable, which is the start variable of $G$,
- $R = R_1 \cup \{S \rightarrow \varepsilon | S_1 S\}$.

From the start variable $S$, we can derive all strings $S_1^n$, where $n \geq 0$. From $S_1$, we can derive all strings of $L$. Hence, from $S_1$, we can derive all strings of the form $u_1 u_2 \ldots u_n$, where $n \geq 0$, and each string $u_i$ $(1 \leq i \leq n)$ is in $L$. In other words, the grammar $G$ generates the star of $L$. Therefore, $L^*$ is context-free.

By the way, the context-free grammar $G = (V_1, \Sigma, R_1, S_1)$, where

- $R = R_1 \cup \{S_1 \rightarrow \varepsilon | S_1 S_1\}$ may not generate $L^*$. Here is an example:

The context-free grammar $G_1 = (V_1, \Sigma, R_1, S_1)$, where $V_1 = \{S_1\}$, $\Sigma = \{0,1\}$, and $R_1 = \{S_1 \rightarrow 0S_10|1\}$ generates the language

$L = \{0^n10^n : n \geq 0\}$.

From the grammar $G$ above, we can obtain the string 00:

$. S_1 \Rightarrow 0S_10 \Rightarrow 00.$

However, this string 00 is not in $L^*$.

For the fourth part, we consider

$L = \{a^mb^nc^n : m \geq 0, n \geq 0\}$

and

$L' = \{a^mb^nc^n : m \geq 0, n \geq 0\}$.

- From Question 3, $L$ is context-free.
- By a symmetric argument, $L'$ is context-free.
- Let $L'' = L \cap L'$.
- $L'' = \{a^nb^n c^n : n \geq 0\}$.
- We have seen in class that $L''$ is not context-free.

The last part is proved by contradiction. Thus, we assume that for any context-free language $A$, the complement $\overline{A}$ is also context-free. Under this assumption, we will show that the intersection of any two context-free languages is also context-free. This will contradict the previous part of the question.

Let $A$ and $B$ be two arbitrary context-free languages.
• By our assumption, both $A$ and $B$ are context-free.
• From the first part: $\overline{A} \cup \overline{B}$ is context-free.
• By our assumption, $\overline{A} \cup \overline{B}$ is context-free.
• By De Morgan, the latter language is equal to $A \cap B$.
